8.2.5 Controlling the override groups	34

1. Introduction

Thank you for selecting the Matrix Controller. The Martin Matrix Controller is designed to reduce programming time of fixtures, arranged in a matrix, to a maximum. At the same time, it relieves your conventional controller of precious DMX-channels, but you will still be able to control your Matrix from the conventional desk.

2. Features

2.1 Hardware

- Pentium based industrial 19" controller
- 2048 DMX output channels standard expandable to 4096 DMX output channels (*)
- 2048 DMX input channels standard expandable to 4096 DMX input channels (*)

(*) All channels are opto isolated. The controller is expandable per 1024 DMX in/out channels.

2.2 Software

- Windows based control software
- Can be used as an independent stand alone matrix controller
- Or slave controlled from any DMX controller. Requires:
 - o 10 DMX channels for main control (master,
 - o 32 DMX channels (if used) for:
 - Preset calling (1-32 channels, depends on number of fixture channels)
 - Preset crossfade timing (1-32 channels, depends on number of fixture channels)
- Up to 500 fixtures, each with a maximum of 32 channels per fixture.
- Uses the same fixtures libraries as the Martin Case controllers
- Storage for 400 programs ordered in 20 pages of 20 programs.
- 4 independent effect engines can run simultaneous. There is a choice between:
 - o Snake effects
 - o Line effects
 - o Circle effects
 - o Rectangle effects
- Text engine to use the matrix as a text display
- 50 presets for each fixture channel to make for example logos
- Possibility to run a matrix effect on every fixture channel
- Automatic recalculation of effects when resizing the matrix

3. Connecting

3.1 Cable connections

The system is delivered with:

- Microsoft Intellipoint mouse
- Power cable
- 2 DMX XLR converters (2048 channel version)

WARNING: Adjust the voltage setting of the Matrix Controller to your local AC power supply before applying power.

Connect:

- A keyboard at the back of the Matrix Controller (MINI DIN) or at the front (DIN 5).
Do not use both connections at the same time.
- A mouse
- An SVGA monitor
- Both XLR converters
- Fixtures or an MSD (Martin Show Designer)
- (A Light desk if you want to control the Matrix from a Light controller)

The XLR connectors are numbered from 1 to 4:

- 1 = DMX OUT line 1
- 2 = DMX IN line 1
- 3 = DMX OUT line 2
- 4 = DMX IN line 2

Depending on the output where they are used, they become

DMX CONNECTOR	XLR Number	Channel Number
DMX 1&2	1	DMX out 1 - 512
	2	DMX in 1 - 512
	3	DMX out 513 - 1024
	4	DMX in 513 - 1024
DMX 3&4	1	DMX out 1025 - 1536
	2	DMX in 1025 - 1536
	3	DMX out 1537 - 2048
	4	DMX in 1537 - 2048

Apply power to the Matrix Controller and switch it on.

3.2 How the DMX is used

3.2.1 On startup

When the Matrix controller is used in 'stand alone' mode (no Light desk connected), all DMX channels will have zero value when starting up.

When the Matrix controller is used together with a light desk connected to it, the DMX is linked through from the input to the output, on startup. As soon as the program 'Logimatrix' is started, the link through will be cut off, and the DMX outputs will follow the actions of the Martix controller.

3.2.2 Stand-alone mode

In 'Stand alone' mode, the Matrix controller is the only controller to generate the light effects. Programs, made on the Matrix controller, are selected by the mouse.

3.2.3 With a light desk connected

When a light desk is connected to the Matrix controller on its DMX inputs, there are 3 possibilities. The light desk:

- Selects the programs made on the Matrix controller
- Generates its own effects on the light matrix
- Selects the programs made on the Matrix controller and at the same time, generates its own effects for some fixture channels on the light matrix.

For every channel of the fixtures in the light matrix, you can decide whether the Matrix controller is in control or the light desk.

4 Starting up

Note: When the system starts up, there will be a message:

Verifying DMI Pool Data

Boot from ATAPI CD-ROM : Failure

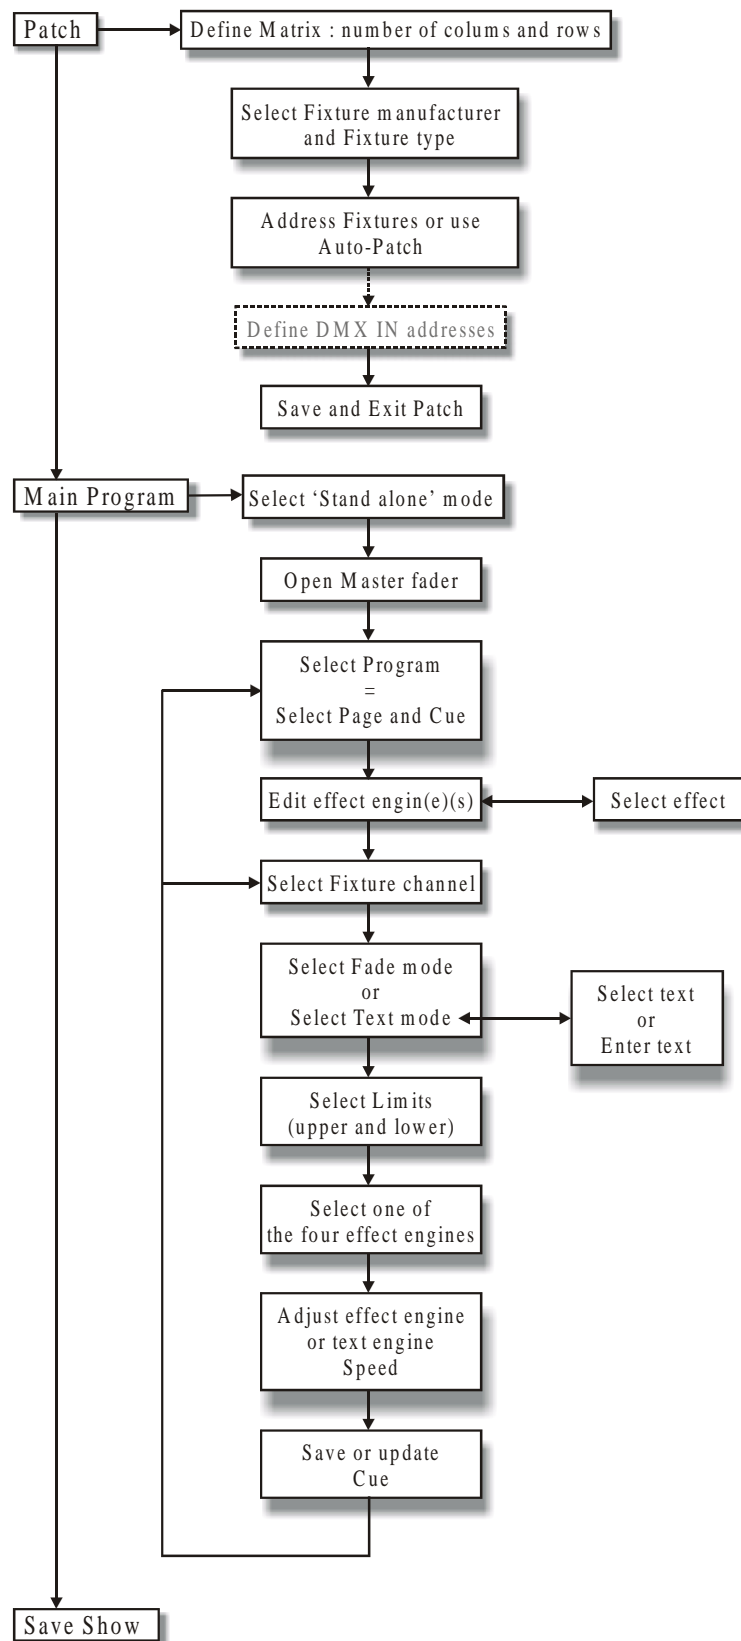

Please ignore the 'failure' message. The system will startup normally.

As soon as the system is started, double click the

icon, and you will enter

5 Programming the Matrix

Programming hundreds of fixtures, arranged in a matrix, was never so easy. All that has to be done is:

- Define the number of fixtures in x and y direction
- Select the fixture type
- Address the fixtures
- Select an effect
- Apply the effect on a fixture channel
- Adjust the speed of the effect

To explain the steps that have to be taken to program the Martix controller, we will make an example with 60 miniMACs profile.

6. Defining the Matrix and Patch fixtures

When the program is active, we will see an empty screen:

The first thing that has to be done is defining the width and height of the matrix, selecting a fixture type and address the fixtures. This is done with the Patch program.

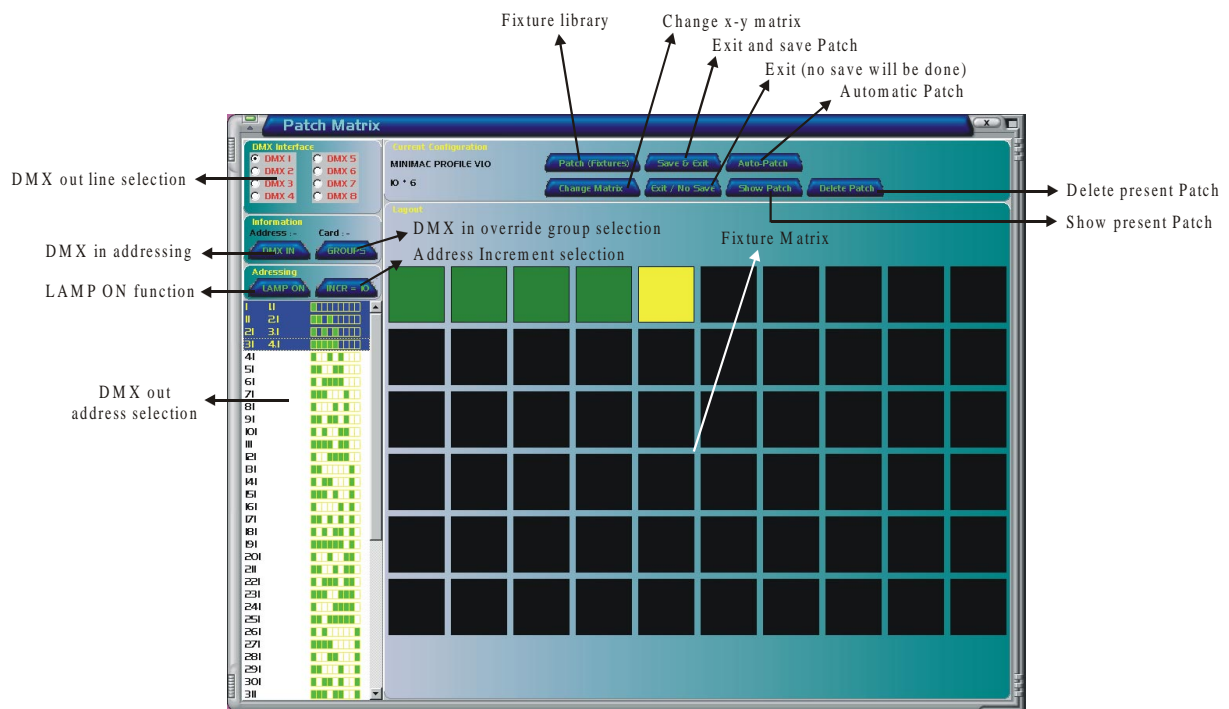

6.1 Patch

In the PATCH program, we will define the matrix (10 wide by 6 high), we will select the miniMAC fixture and address those 60 fixtures.

[Select the MENU button] [Select Patch]

The PATCH program will start:

DMX OUT line selection: Here the output channel will be selected. If the line is **RED**, then the output is not available. **Black** outputs are available.

- DMX 1: channels 1 – 512
- DMX 2: channels 513 – 1024
- DMX 3: channels 1025 – 1536
- DMX 4: channels 1537 – 2048
- DMX 5: channels 2049 – 2560
- DMX 6: channels 2561 – 3072
- DMX 7: channels 3073 – 3584
- DMX 8: channels 3585 – 4096

DMX IN addressing:	To address DMX inputs when a conventional light desk will control the Martix Controller.
Lamp On function:	While addressing the fixtures, the fixture lamps can be struck.
DMX OUT address selection:	If fixtures must be addressed manually, run with your mouse pointer over the addresses.
DMX IN override groups selection:	Used to address the DMX IN range for override groups (presets) and their fade timings. (only used when controlling from a conventional light desk)
Address increment selection:	<p>If fixtures are addressed manually, the addresses can be shown by:</p> <ul style="list-style-type: none"> ▪ Increment 1 ▪ Increment per number of fixture channels
Fixture matrix:	<p>The field shows the layout of the light matrix. It is important that the layout order corresponds with the fixtures in the actual light matrix.</p> <ul style="list-style-type: none"> ○ Green = addressed ○ Yellow is currently active ○ Black = not addressed yet
Fixture library:	A library of fixture manufacturers and fixture types. The system uses the same fixture libraries as the Martin Case controllers.
Change X-Y matrix:	To define the number of fixtures in X and Y direction.
Exit and save patch:	When leaving the Patch program, the patch should be saved.
Exit (no save will be done):	To cancel all changes and return to the main program.
Automatic Patch:	When fixtures in the light matrix are arranged in successive order, starting from the top left to the bottom right, the automatic patch will address all fixtures automatically.
Delete present Patch:	To delete all addresses from the patch.
Show present Patch:	This gives an overview of the fixtures in (x,y) direction, their addresses and the used DMX output.

6.2 Patch example step by step

Suppose we have a matrix of miniMACs profile, arranged in successive order from the top left to the bottom right. We have also a conventional light desk that will be used to control the Martix controller. In the example, we will show you how to work with the light desk, but the desk is not really necessary to follow the example.

The first thing that has to be done is: define the number of fixtures in the matrix.

[Select the CHANGE MARTIX button] [Enter the amount of fixtures in X and Y direction] [Click OK]

All fixtures will appear now on your screen as black boxes.

Now we have to select a fixture type.

Note: The Matrix controller accepts only one fixture type. It is impossible to make a matrix mix with different fixture types.

[Select PATCH (fixtures)] [Select the manufacturer and fixture type]

Since we will make a matrix of Martin miniMAC profile, we select this fixture.

Each fixture in the Matrix has to have an address. We can address them manually by:

[Select a FIXTURE box] [Select the DMX output (1-8)] [Select the address from the dipswitch window]

Since no fixtures have an address yet, all fixture boxes will be black. When one of them is selected, the box will become yellow. If the address is set, the box will be green, meaning that the fixture is patched.

We can address all fixtures manually, but since we have a light matrix in successive order from the top left to the bottom right, it will be easier to address all fixtures automatically:

[Select AUTOPATCH and confirm]

If some of the fixtures have other addresses than given by the auto patch, it is always possible to change it manually.

If you work in 'Stand Alone' mode (no extra light desk connected), then the patch is ready at this point. The only thing that has to be done is save.

[Select SAVE & EXIT]

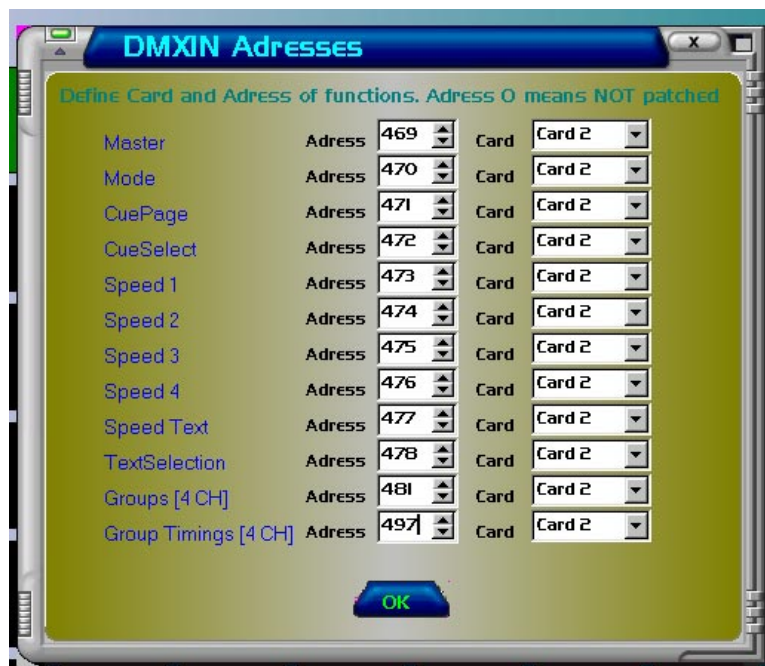

*However, when a controlling light desk is connected, we have to address its control channels. On the light desk, a 10-channel fixture has to be made and addressed. If the controlling light desk is a Martin Case controller, you can select the 'MATRIX BLACKBOX' from the 'CASEFIXTURES' library. The DMX address given to this fixture **MUST have a unique address, which not overlaps with the fixture addresses on the Matrix controller.***

The controlling desk can be used in 3 ways. It can control:

- The Matrix controller and its presets (override groups or groups). In this case, the light desk sees the Matrix controller as a normal 10-channel fixture (if presets are used also, you need to setup also 2 fixtures of 4 channels at a unique address).
- The light matrix itself when the DMX through option of the Martix Controller is used. In this case, the light desk should have the same fixture setup as the Martix controller.
- Both, the Matrix controller with presets and the light matrix.

The DMX input of the Matrix Controller must be set at the same address of the MATRIX BLACKBOX on the light desk.

[Select DMX IN] [Enter DMX addresses that are not in the fixture range]

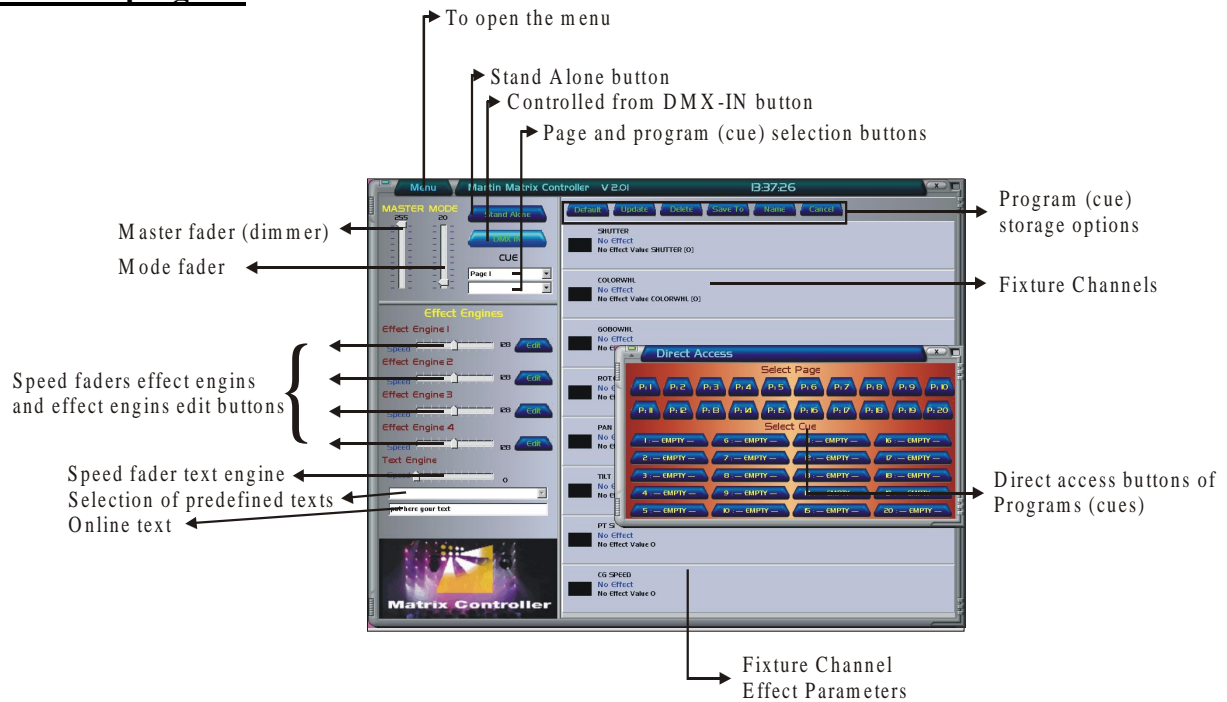

Note: Card 2 means the same as Line 2.

Explanation: In this example, we have chosen address 469 on line 2 as a DMX input. This means that; if the conventional light desk has a fixture at address 469 on the incoming 2nd DMX line of the Matrix Controller, we will be able to control the Master fader of the Matrix Controller from the fixture at address 469 of the light desk. We will explain the other channels in the main program.

The use of presets will be explained later.

To save the Patch, click the SAVE & EXIT button.

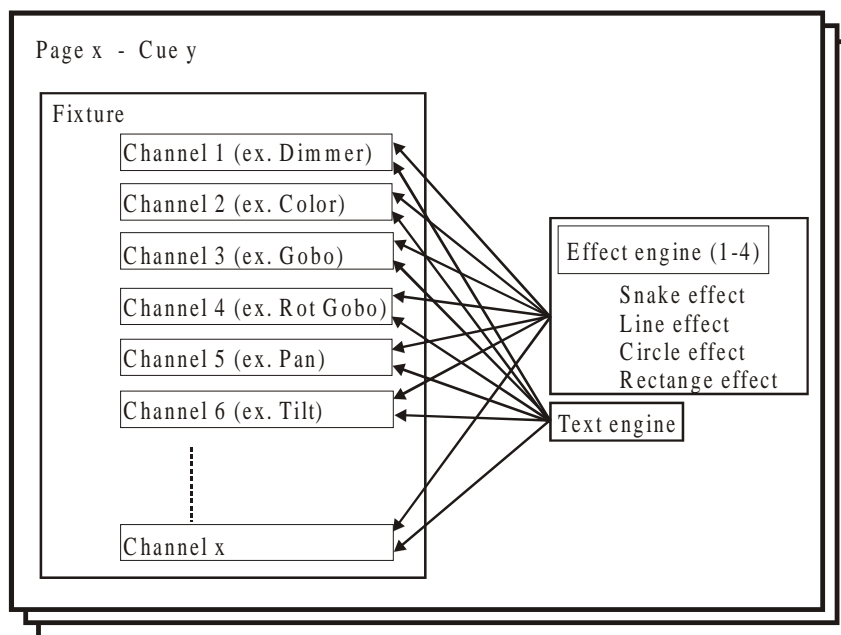

7 The main program

7.1 How the main program is used

There are 20 pages of 20 cues.

- Each cue holds:
 - o All fixture channels
 - o 4 effect engines
 - o 1 text engine

On every fixture channel, one of the 4 effect engines or the text engine can generate an effect. The effect will be active between the fixture channels limits.

The fixture channel limits are entered:

- By a number
- By the direct access field (ex. Between color white and yellow)
- By a preset

Note: The fixture channel limits may be negative and may exceed value 255. This will be explained in the example.

7.2 The main screen

7.2.1 The menu button

Initial settings, like defining the matrix, selecting the fixture type, addressing the fixtures..., show loading and saving options, DMX timing settings etc. can be accomplished in the menu.

7.2.1.1 Show

To store/load the entire programmed Matrix show on/from the hard disk or the floppy drive.

7.2.1.2 Parameters

The parameters button includes:

- Patch:
 - o Definition of the matrix
 - o Selecting the fixture type
 - o Addressing fixtures
 - o Addressing the DMX-IN inputs
- Make Presets:
 - o To define your own logos to be displayed on the Matrix. There is storage for 50 presets on each fixture channel.

- Cross fading times can be applied for fading between 2 logos.
- Text:
 - There is storage for 20 pre-defined texts, to use the Matrix as a text display. On top of this, texts can also be entered 'on the fly'.
- Priorities:
 - To define the priorities of the running Matrix.
 - **Attention, playing with the priorities can slow down the Matrix program enormously.**
- DMX timings:
 - Some older fixtures may react wrong on the standard DMX timings. **Attention, changing the DMX timings can result in strange behavior of the fixtures.**

7.2.1.3 View

To activate/deactivate the preset override screen (with X-fade timings) and the Direct Access cue window.

7.2.1.4 Options

Some special fixture functions like reset, lamp on, lamp off, can be applied directly on the entire matrix. The **lamp on function** will strike **all lamps one by one**, to avoid power surges.

7.2.1.5 Exit

To close the program.

Attention: The program runs in a Windows environment, please shut down the system properly by using the Windows START button.

7.2.2 Stand-alone button and 'Controlled from DMX-IN' button

When no light desk is connected to the Matrix controllers DMX inputs, or when programming effects, the Matrix controller should be set in 'Stand Alone' mode.

In 'Stand Alone' mode, all faders (Master, Mode and speed) are accessible through the mouse.

The Matrix controller can be controlled from an external light desk via its DMX-IN inputs (see 'Controlling the matrix from a light desk'). Enable the 'DMX-IN' button if you want to do so.

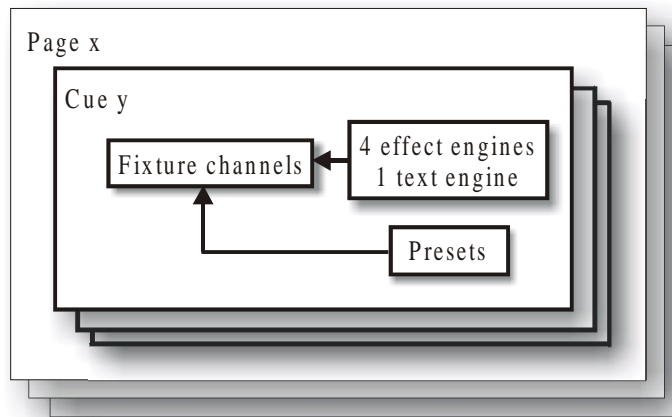

7.2.3 Page and program (cue) selection buttons and Direct Access buttons

A cue is a program. Programs are divided into 20 pages of 20 cues.

One cue can hold:

- 4 effect engines
- 1 text engine
- Effects for all channels of the selected Matrix fixture.

CUE

Every cue holds all channels of the fixtures. On those channels, an effect can be applied with 1 of the 4 effect engines (every cue, there are 4 new effect engines), or the text engine. When the effect is running on a fixture channel, it is running between 2 limits. Those limits can be set using:

- Digital values
- Direct access values (ex. Color white and green, or between dimmer closed and open)
- Pre-defined presets

To select a cue:

[Select a page] [Select a cue]

7.2.4 Master fader

To open or close the dimmers of all fixtures instantly. In 'Stand alone' mode, the fader is set with the mouse. When controlling from a light desk, the fader is set on the light desk.

7.2.5 Mode fader

There are 2 modes for this fader:

- DMX through
- Chase

In **DMX through mode**, the **fixture matrix is controlled from a connected light desk**. This means that the light desk has to hold the same fixture setup as the Matrix controller. The incoming DMX on the Matrix controller will be sent instantly to the DMX outputs. The Matrix controller doesn't change DMX values in this mode.

In Chase mode, the Matrix controller controls the fixture matrix. Matrix controller cues can be selected from a connected light desk (for DMX channels, see Paragraph: Controlling the Matrix controller from a light desk), or with the mouse in 'Stand Alone' mode.

Note: When the Matrix controller is used in 'Stand Alone' mode, the mode fader must be set in Chase mode to be able to select Cues.

7.2.6 Effect engines

For every cue that is selected, there are 4 new effect engines. Every effect engine has its own effect speed.

There are 4 main effects for an effect engine:

- Snakes
- Lines
- Circles
- Rectangles

To select an effect for an effect engine:

<i>[Select a cue (page + cue)] [Edit an effect engine with its EDIT button]</i>

To see the effect, the effect must be applied on a fixture channel, and the speed must be set.

7.2.6.1 Snake effects

3 snake effects are available:

- Random: The fixture channel on which the random effect is applied will be selected at random.
- Lines: The effect will select the fixture channel in a line order (see figure), starting from the bottom to the top.
- Real Snake: The effect will select the fixture channel in a snake order, starting in the middle (see figure).

The direction of the 'lines' and 'real snake' effect can be inversed.

The amount of snakes in 'real snake' mode, is selectable and the effect can be mirrored.

Snakes

7.2.6.2 Lines

There are 8 line effects:

- Rotating line
- Line BR (bottom right) to TL (top left)
- Arrow
- Diagonal Cross
- Vertical Cross
- Diagonal lines
- Diagonal Double Lines
- Diagonal Double Lines Mode

Every effect can be inversed (direction).

Rotating Line

Line BR to TL

Arrow

Diagonal Cross

Vertical Cross

Diagonal Lines

Diagonal Double Lines

Diagonal Double Lines Mode

7.2.6.3 Circles

There are 2 circle effects:

- Outside – Inside
- Inside – Outside

They can both be set for a random center point.

7.2.6.4 Rectangles

Like the circles, there are 2 effects:

- Outside – inside
- Inside – Outside

7.2.7 Text engine

The text engine is an effect engine, but it displays only texts when it is applied on a fixture channel (ex. The dimmer channel).

Texts can be displayed on a matrix with minimum dimensions of 5 fixtures by 5.

It is possible to display pre-stored texts or to display texts ‘on the fly’.

To run the text engine, the engine must be applied on a fixture channel and its speed must be set.

7.2.8 Program (cue) storage options

The selected cue can be stored using those options. When effect engines have been prepared, and when the effect engine(s) have been applied on the fixture channel(s), the cue must be stored.

There are 5 options:

- Default: To put the fixtures back to their defaults i.e.: Dimmer open, no color, no gobo and Pan/Tilt at halve their values. All effect engines will be removed from the channels (not deleted).
- Update: To store changes to a previous stored cue.
- Delete: To delete the cue.
- Save to: To store the settings of the effect engines and the effects applied on the fixture channels.
- Name: To rename the cue.

7.3 An example

We will use in the example, the 10 by 6 matrix of miniMACs that we've prepared in the Patch.

As we have explained, we have to select first a cue, edit its effect engine(s) and then apply the effect engines on one or more control channels (with upper and lower limits of the channel). The last step that has to be done is: save the cue.

Before we begin:

- **Select the 'Stand Alone' box**, to be able to control the Matrix controller with the mouse.
- **Open the Master Fader.**

7.3.1 Select a cue

First we have to select a cue.

Select a Page and a Cue in the Direct Access box.

In case of a new show, all cues will be empty.

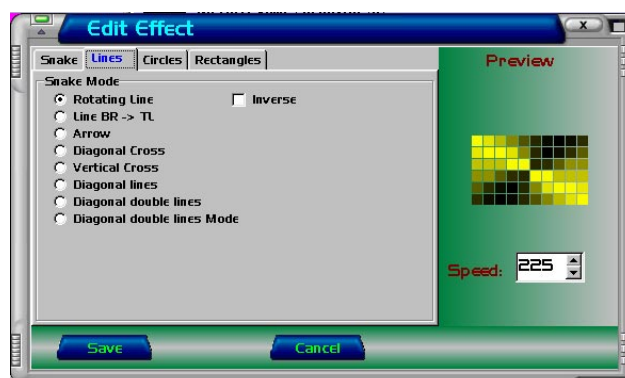

Note: When the cue is selected, the mode fader will automatically go into chase mode when he was on DMX-in.

7.3.2 Edit one or more effect engines

In every cue, we have 4 new effect engines.

Open an effect engine with its EDIT button:

In the effect engine, we can select the snakes, lines, circles or rectangle effects.

When effect is chosen, select the **SAVE** button. Suppose we want a snake effect (real snake, amount horizontal=2, amount vertical=2, mirrored):

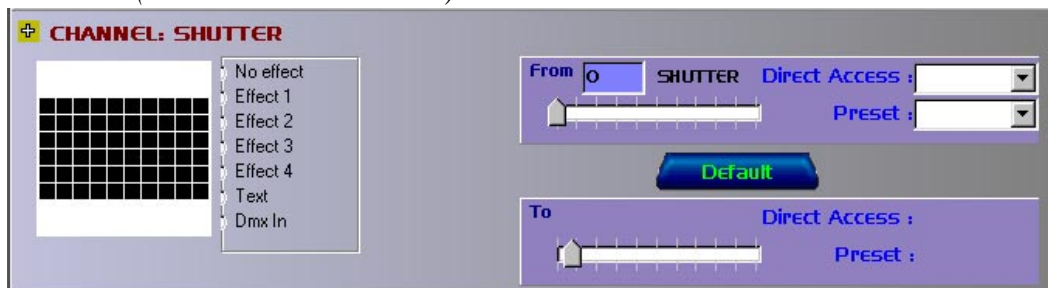

- Select 'SNAKE'
- Select 'REAL SNAKE'
- Enter the amounts
- Select 'MIRROR'
- SAVE

Now, one effect engine is prepared. You can edit the 2nd, 3rd or 4th effect engine if you want more effect engines available in this cue.

7.3.3 Apply the effect on a channel

The effect engine(s) can now be applied on one or more channels.

Click a channel (ex. The shutter channel)

A window will open at the bottom. In this channel window, we can:

- Select the effect:
 - o No effect
 - o An effect engine:
 - Select the fade mode:
 - Cross-fade (x-fade)
 - ON-OFF wave: no fading
 - Step (future use)
 - o Text effect
 - o Set this channel on DMX-in
- Select the limits of the effect (from – to)

We will apply the snake effect of the previous paragraph on the shutter channel:

- Select 'Effect 1' and 'X-FADE' (the TO, and an effect engine select window will open)
- Select in the TO window, the direct access field, and select 'OPEN'

We have now an effect running with Effect engine 1 (if you want another effect engine running on this shutter channel, you can select it in the effect engine box). The effect is running between value 0 and 20 (open).

If you don't see the effect, the effect engine speed of effect engine 1 may be 0. *You can adjust the effect speed with the effect engine fader.*

Suppose: in this cue, we want also a color effect, another gobo, and Pan/Tilt values have to be adjusted:

- *Edit effect engine 2*
 - o *Select rotating line*
 - o *Save*
- *Open the color channel*
 - o *Select direct access **from** 'Pink'*
 - o *Select direct access **to** 'Red'*
 - o *Select 'ON-OFF fade'*
 - o *Select 'effect engine 2'*
- *Open the gobo channel*
 - o *Select 'no effect'*
 - o *Select direct access from 'Stardust'*
- *Open the Pan channel*
 - o *Select 'Default' (the default value is 127 with no effect)*
- *Open the Tilt channel*
 - o *Select 'Default'*

Our effect is now ready and running. The only thing that has to be done is: Save the Cue:

- *Select 'Save to'*
- *Select 'Page 1 – Cue 1'*
- *Enter a name (ex. Colored snake')*

The name will appear in the 'Cue Direct Access' window.

Note: To save the effect, it is also possible to select 'Update' (because we've selected Page 1, cue 1 when we started) and then select 'Name'.

7.3.4 Make a text effect

In cue 2 of page 1, we will create a text effect. The text should appear on the shutter channel, with gobo 'dot sh' (for those who want to see it clearly on an MSD (Martin Show Designer)) and with Pan/Tilt on default.

- *Select Page 1 cue 2*
- *Select the 'Shutter' channel*
 - o *Select 'Text'*
 - o *Select **to** 'Open'*
- *Adjust Text engine speed*
- *Select the 'Gobo' channel*
 - o *Select 'No Effect'*
 - o *Select **from** 'Dot sh'*
- *Select the 'Pan' channel*

- Select 'Default'
- Select the 'Tilt' channel
 - Select 'Default'
- Select 'Save to'
 - Page 1 cue 2
 - Name 'Dimmer text'

The text that will be displayed will be: 'put here your text'

You can replace the text in the field, but this text will **not be stored into the cue**. If you wish to store a text into this cue, you must first edit some texts and select them **before you save the cue**:

- Select in the 'Menu': 'Parameters – Text'
- Enter some texts
- Select the text

- Save or update the cue

Note: The text will run continuously: "Hello WorldHello WorldHe....". Add some spaces after the word 'World' if you want a separation.

7.3.5 Notes on the channel limit values

As mentioned, channel limits may exceed the maximum (255) and minimum (0) channel values. Values may be 2,000 or -2,000.

Explanation:

Suppose, we have an effect engine running as a sine wave and we want the dimmer channel to Flash (short bursts of light, longer dark periods).

Warning: Some channels like the shutter channel on the miniMAC, contain values for reset, lamp off and lamp on. Those functions will be activated when the upper limit is bigger than one of those function values.

7.4 Controlling the Matrix Controller from a light desk

When a light desk is connected to one of the Matrix Controllers DMX-inputs, and it has a unique address, as explained in the Patch program, it can control the Matrix Controller.

The Matrix controller requires 10 DMX channels from the light desk for main control, and 2 x 4 channels for preset control:

- Main control:
 - o Master fader
 - o Mode fader
 - o Page selection
 - o Cue selection
 - o Speed fader effect engine 1
 - o Speed fader effect engine 2
 - o Speed fader effect engine 3
 - o Speed fader effect engine 4
 - o Speed fader text engine
 - o Text selection
- Preset Selection (4 channel)
- Preset X-fade time (4 channel)

Example: The DMX-in was patched on the Matrix controller at address 469 on line 2. When DMX-in line 2 of the Matrix controller is connected with a light desk that has a 10 channel fixture at address 469, we can control the Matrix Controller:

<i>Light desk</i>	<i>Matrix Controller</i>	<i>DMX Value</i>
<i>Channel 1</i>	<i>Master Fader</i>	<i>0 – 255</i>
<i>Channel 2</i>	<i>Mode Fader</i>	<i>0 - 19 : DMX through 20 – 39 : Chase 40 – 255 : not used</i>
<i>Channel 3</i>	<i>Page Selection (mode fader in chase mode)</i>	<i>0 – 12 : Page 1 13 – 24 : Page 2 25 – 36 : Page 3 37 – 48 : Page 4 244 – 255 : Page 20</i>
<i>Channel 4</i>	<i>Cue Selection (mode fader in chase mode)</i>	<i>0 – 12 : Cue 1 13 – 24 : Cue 2 25 – 36 : Cue 3 37 – 48 : Cue 4 244 – 255 : Cue 20</i>
<i>Channel 5</i>	<i>Speed Fader Effect engine 1</i>	<i>0 - 255</i>
<i>Channel 6</i>	<i>Speed Fader Effect engine 2</i>	<i>0 - 255</i>
<i>Channel 7</i>	<i>Speed Fader Effect engine 3</i>	<i>0 - 255</i>
<i>Channel 8</i>	<i>Speed Fader Effect engine 4</i>	<i>0 - 255</i>

<i>Channel 9</i>	<i>Speed Fader Text engine</i>	<i>0 - 255</i>
<i>Channel 10</i>	<i>Text selection</i>	<i>0 – 12 : Text 1</i> <i>13 – 24 : Text 2</i> <i>25 – 36 : Text 3</i> <i>37 – 48 : Text 4</i> <i>....</i> <i>244 – 255 : Text 20</i>

Note 1: To be able to control the Matrix Controller from an external desk, deselect 'Stand Alone' mode on the Matrix Controller.

Note 2: When the mode fader is set at DMX-IN, the DMX-inputs are patched to the DMX-outputs. When the light desk contains the same fixture setup as the Matrix Controller, the light matrix listens to the light desk instead of to the Matrix Controller.

8. PRESETS and Overrides

Why overrides?

- The main purpose of overrides is; to be able to control for each channel if the channel should follow the Matrix Controller, or if it should follow DMX coming in on the DMX inputs or if the channel should go to a Matrix defined preset. To make the transition between the modes smooth, override crossfade timings can be used, even between presets.

Why presets?

- To design custom logos applied on fixture channels like, for example the color channel
- To create some variation in the effects; instead of using the same channel limits for all fixtures, use a variation (preset) to define the channel limits. For example on the color channel: instead of going from green (for all fixtures in the matrix) to red (for all fixtures), go from a combination of colors to another combination of colors.

What is an override group?

An override group combines one or more fixture channels. We can combine for example the Pan and Tilt channel to one override group so that if we call a Matrix Controller preset for the Pan channel, the Tilt channel preset will be loaded too.

Up to 4 override groups can be defined.

Override Group 1	Up to 50 dimmer presets
Override Group 2	Up to 50 color presets
Override Group 3	Up to 50 Gobo presets
	Up to 50 Rot Gobo presets
Override Group 4	Up to 50 Pan presets
	Up to 50 Pan Fine presets
	Up to 50 Tilt presets
	Up to 50 Tilt Fine presets
	Up to 50 PT speed presets
	Up to 50 Col/Gob speed presets

Example for miniMAC profile

In the example for the miniMAC matrix, we can define 4 override groups:

- Group 1 for the dimmer presets
- Group 2 for the color presets
- Group 3 for the Gobo presets
- Group 4 for the Pan/Tilt presets

Each of those 4 override groups has its own **crossfade timings**. This is the time to fade from one preset to another.

8.1 Presets

There are 50 presets available for every fixture channel. Every preset contains a combination of values for 1 fixture channel.

For example, we want to create a color preset:

- The 8 inner fixtures have to be in red
- The outer fixtures have to be in blue
- In between the fixtures have to be in green

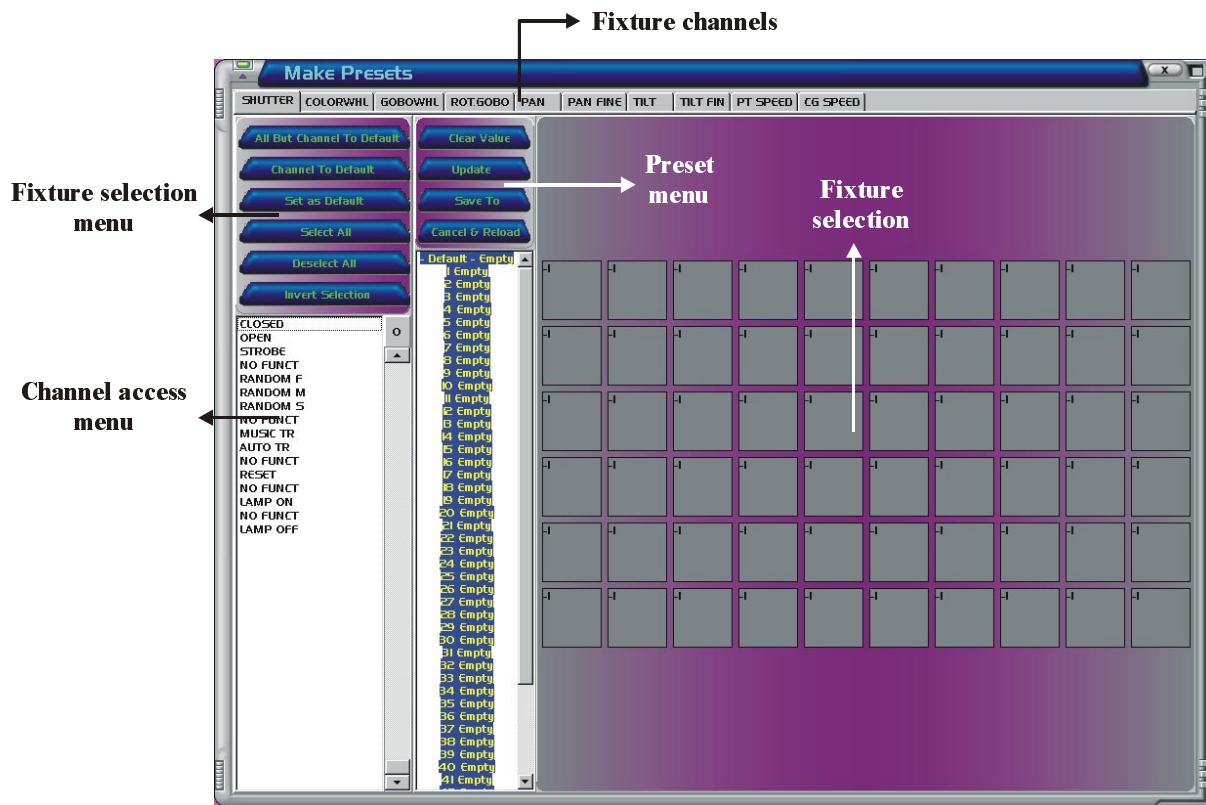

8.1.1 Preset screen

To create presets, select:

[MENU] [PARAMETERS] [MAKE PRESETS]

You will enter Preset mode:

Fixture channels: To select the channel on which the preset has to be applied

Fixture selection: To select or deselect a fixture in the Fixture matrix.

- Mouse left button: to select a fixture
- Mouse right button: to deselect a fixture

Note: you can hold down the mouse button while moving over the fixtures to make a selection.

Fixture selection menu: To make global selections, or to set channel(s) to their default.

Channel access menu: To select a direct access channel for the selected fixtures

Preset menu: To save or load presets

8.1.2 An example

Let's create the color example:

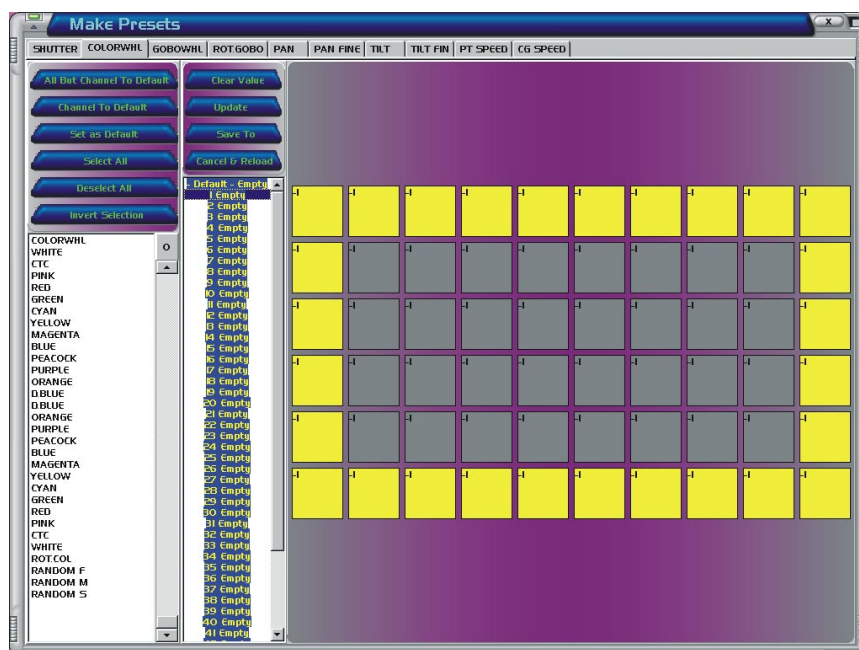

*[Click
COLORWHL]*

To move to the color presets on the color wheel.

[Select a preset number in the 'preset menu']

[Left click the outer fixtures in the 'Fixture selection' area]

To select the fixtures

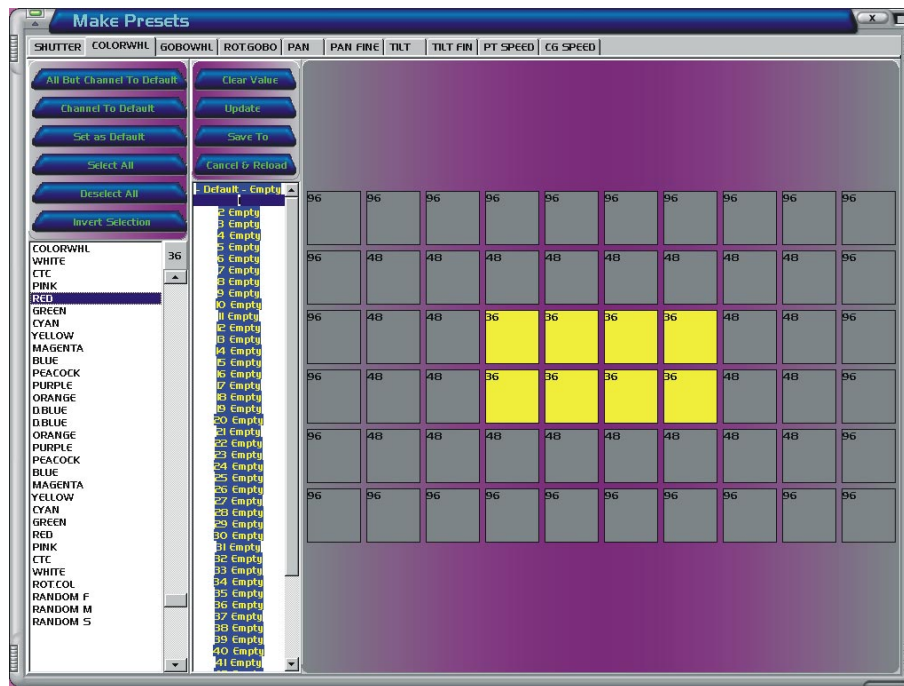

[Select the color 'blue' from the 'channel access menu']

The value from the selected fixtures will be '96'.

[Select 'Deselect ALL' from the 'fixture selection menu']

Now we can select other fixtures and give them another color. Repeat these steps until we have the colors from the example. It should look like this:

[Select 'Update' or 'Save to' from the 'preset menu']

- Update to save to the selected preset
- Save to, to save to another preset.

We can create presets for the color wheel, the gobo wheel, for Pan/Tilt....

Note: When 2 or more channels are grouped into override groups, use the same preset number for the grouped channels. Since override groups are combinations of channels, and since calling a preset in an override group will call the same preset number for those channels, it is important that the presets match with each other. For example, if Pan and Tilt are combined in an override group, then calling Pan preset number 5 (called from the overrides) will load automatically Tilt preset number 5.

The presets can now be used when an effect is created on a channel. Instead of using the values or the direct access (see paragraph '7.3.3 Apply the effect on a channel') we can also use the presets in the 'from – to' fields.

8.2 Override groups

Override groups are only used when the Matrix Controller itself is controlled from an external light desk. With the override groups, we can call presets on the Matrix Controller and also their crossfade times.

Note: As shown in the Patch Example (see 6.2 Patch Example Step by Step) **we have to address 2 4-channel fixtures on the external light desk and on the Matrix Controller.**

- 1 4-channel fixture to call the 4 groups of presets (let's call it override group fixture)
- 1 4-channel fixture to set the crossfade timings (let's call it crossfade fixture)

With the 'override group fixture', we can select:

- MX mode or Martix mode. This mode is the normal mode as if we don't use the overrides.
- DMX-IN mode. In this mode, the DMX-IN is patched to DMX-OUT for the grouped fixture channels, as if the Matrix Controller doesn't exist for those channels. Those Fixture matrix channels are now controlled on the external light desk (if the same fixture setup exists on this controller). The Matrix controller is not totally disabled in this mode, because we can use crossfade timings (on the 'crossfade fixture') to go to the DMX-IN values and the other channels that are not involved in the group will still follow Matrix Controller actions.
- Preset mode. We can select one of the 50 presets with crossfade timings, set with the 'crossfade fixture'.

With the 'crossfade fixture', the crossfade timings are set for the same 'override group fixture' channel.

8.2.1 Override fixture DMX values

DMX value from external light desk for 'override fixture' (4 channel fixture: all channels have the same values)	Matrix Controller Mode
0 - 48	Matrix Mode
49 - 55	DMX IN Mode
56 - 59	Preset 1
60 - 63	Preset 2
.....	Preset X
252 - 255	Preset 50

8.2.2 Crossfade fixture DMX values

DMX value from external light desk for 'crossfade fixture' (4 channel fixture: all channels have the same values)	Matrix Crossfade Time
0 - 255	0 sec - 25.5 sec.

8.2.3 Example

Up to 50 dimmer presets	Up to 50 color presets	Up to 50 Gobo presets	Up to 50 Rot Gobo presets	Up to 50 Pan presets	Up to 50 Pan Fine presets	Up to 50 Tilt presets	Up to 50 Tilt Fine presets	Up to 50 PT speed presets	Up to 50 Col/Gob speed presets
Override Group 1	Override Group 2	Override Group 3	Override Group 4		Override group fixture				
Crossfade time channel 1	Crossfade time channel 2	Crossfade time channel 3	Crossfade time channel 4		Crossfade fixture				

Example for miniMAC profile

In this example:

- Override group 1 groups the dimmer (shutter) channel in the 'override group fixture' channel 1. The crossfade for this channel is set on the 'crossfade fixture' channel 1.
- Override group 2 groups the color channel in the 'override group fixture' channel 2. The crossfade for this channel is set on the 'crossfade fixture' channel 2.
- Override group 3 groups the gobo and Rot Gobo channels in the 'override group fixture' channel 3. The crossfade for this channel is set on the 'crossfade fixture' channel 3.
- Override group 4 groups the Pan-Pan Fine-Tilt-Tilt Fine channels in the 'override group fixture' channel 4. The crossfade for this channel is set on the 'crossfade fixture' channel 4.

If we set on the external light desk, 'override fixture' channel 4 in:

- MX mode, then the Pan/Tilt (+ fine channels) will follow the actions programmed on the Matrix controller
- DMX-IN mode, the Pan/Tilt (+ fine channels) will follow the actions programmed on the external light desk.
- Preset mode, then presets (the same preset number on Pan, Tilt (+ fine channels) will be selected) are called on the Matrix Controller.

8.2.4 Assigning the groups

First the fixture channels must be assigned to an override group:

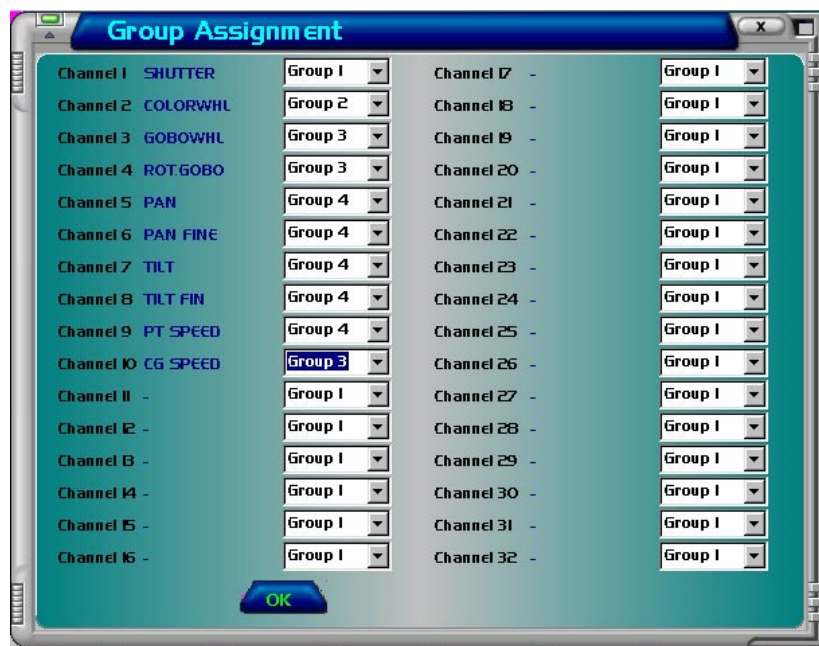

We enter the patch program with:

[MENU] [PARAMETERS] [PATCH]

Select the groups button:

[GROUPS]

Assign the fixture channels to one of the four groups:

Note 1: Since we must assign a group to a channel, we've selected in group 4 also the Pan/Tilt speed and in group 3 also the color/Gobo speed.

Note 2: Do not forget to assign also a DMX-IN channel to both, the override fixture and the crossfade fixture (see 6.2 Patch Example Step by Step).

8.2.5 Controlling the override groups

The override groups can now be controlled from the external light desk. We can see the overrides and their crossfade timings in the Main screen:

[MENU] [VIEW] [OVERRIDES]

This will open the override screen.

In this view, only the first 10 fader fields will be used, since in our example, the fixture is a miniMAC profile with 10 channels.

If we now give a value for 'override fixture' channel 1 on the external light desk, we will see the first fader going to this value. If we give a value to 'override fixture' channel 4, we will see 5 faders going to the value (Pan- Tilt (+ fine channels + speed channel)).

If a value is given for 'crossfade fixture' channel 4, we will see a crossfade time coming up for the Pan Tilt (+ fine channels + speed channel).

For example:

On the external desk, we program a first step:

Override channel 4	Crossfade channel 4
Value 0 (MATRIX)	Value 0

This means that the Pan Tilt (+ fine + speed) follow the actions programmed on the Matrix Controller (ex.: a Pan/Tilt cue). The crossfade time is 0 sec.

The second step on the external desk:

Override channel 4	Crossfade channel 4
Value 49 (DMX-IN)	Value 155

This means that the Pan Tilt (+ fine + speed) will follow some programs coming in on the DMX-IN of the Matrix Controller, thus programmed with the external light desk, since DMX is patched through for those channels in the Matrix Controller. The crossfade timing is 155, which means that the Pan/Tilt cue (from step 1) is fading to the DMX-IN values (from step 2) in 15.5 sec.

The third step on the external desk:

Override channel 4	Crossfade channel 4
Value 60 (PRESET 2)	Value 255

This means that Preset 2 is called on the Matrix Controller only for Pan/Tilt (+ fine channels + speed channel (the same preset number for Pan, Tilt, their fine channels and the speed). The Preset is faded in from the DMX-IN values (from step 2) in 25.5 sec.
