

## Software Bug P3 System Controller

---

When generating test patterns from the P3 System Controller to the VDO Face 5 panel, we have experienced that it looks as if there is an area of dead pixels on the panel with address 39. Please refer to the black rectangle with the red dot on the image below. The bug is inside the test pattern generated by the P3 system controller and it is only visible when running a static test pattern. The dead pixel area is not present when running normal content on the panel.

The bug will be corrected in the next P3 System Controller software release.
